Question

Does the presence of a mobile phone present a barrier to human interactions, especially during meaningful conversations?

Experiment 1

- 74 participants
- Two people at a time in a room
 - (No personal belongings)
- Conversation topic: “Discuss an interesting event that occurred to you over the past month.”
 - Discuss for 10 minutes
- After conversation, questionnaire about relationship quality
 - E.g., “It is likely that my partner and I could become friends if we interacted a lot”

Setting & conditions

- Two conditions
 - phone absent
 - phone present

Figure 1. Overhead view of lab room. 1. Mobile phone or pocket notebook. 2. Book on desk. 3. Chairs used by participants.

Results

- “...individuals in the mobile phone condition reported lower relationship quality after the interaction”
- “...those in the mobile phone condition reported less closeness with their partners”

Experiment 2

- Same idea as experiment 1
- 68 people
- Conditions:
 - phone
 - present
 - absent
 - conversation
 - meaningful: discuss the most meaningful events of the past year
 - casual: discuss feelings about plastic Christmas trees

Results

- Analysis “...showed no effect of phone when the conversation was casual”; “On the other hand, the presence of the mobile phone predicted lower relationship quality when the conversation was meaningful.”
- “...when the conversation was casual the presence of a mobile phone had no effect on partners’ trust...” “...yet partners who attempted to share a meaningful conversation in the presence of a phone reported less trust than those who did so in its absence.”
- “...when the conversation was meaningful the presence of a phone predicted less perceived empathy following the conversation.”

Can you connect with me now?

- Do the results speak to you?
- Flaws in study/avenues for more exploration?
 - different devices? e.g. electronics with no social possibilities such as Kindle or iPod?
 - more people in conversation?
 - different settings
 - established couples vs new

When computers fade...

- Have computers disappeared into our everyday lives?
- Do today's mobile devices infer and act on our goals and contexts? How?
 - Is it a good idea?
- What's the right balance between explicit user action and automatic computer action?
- Adaptive UIs a good idea? Or should the user be responsible for adapting?

Chapter 1

- emotional responses to technology
 - *visceral*: your immediate response
 - *behavioral*: as you use it
 - *reflection*: how it makes you feel about yourself
- Scottish sitting room: do agree something has been lost?

Why do you take photos (with your phone)?

Touch screen dominance

New interaction paradigms

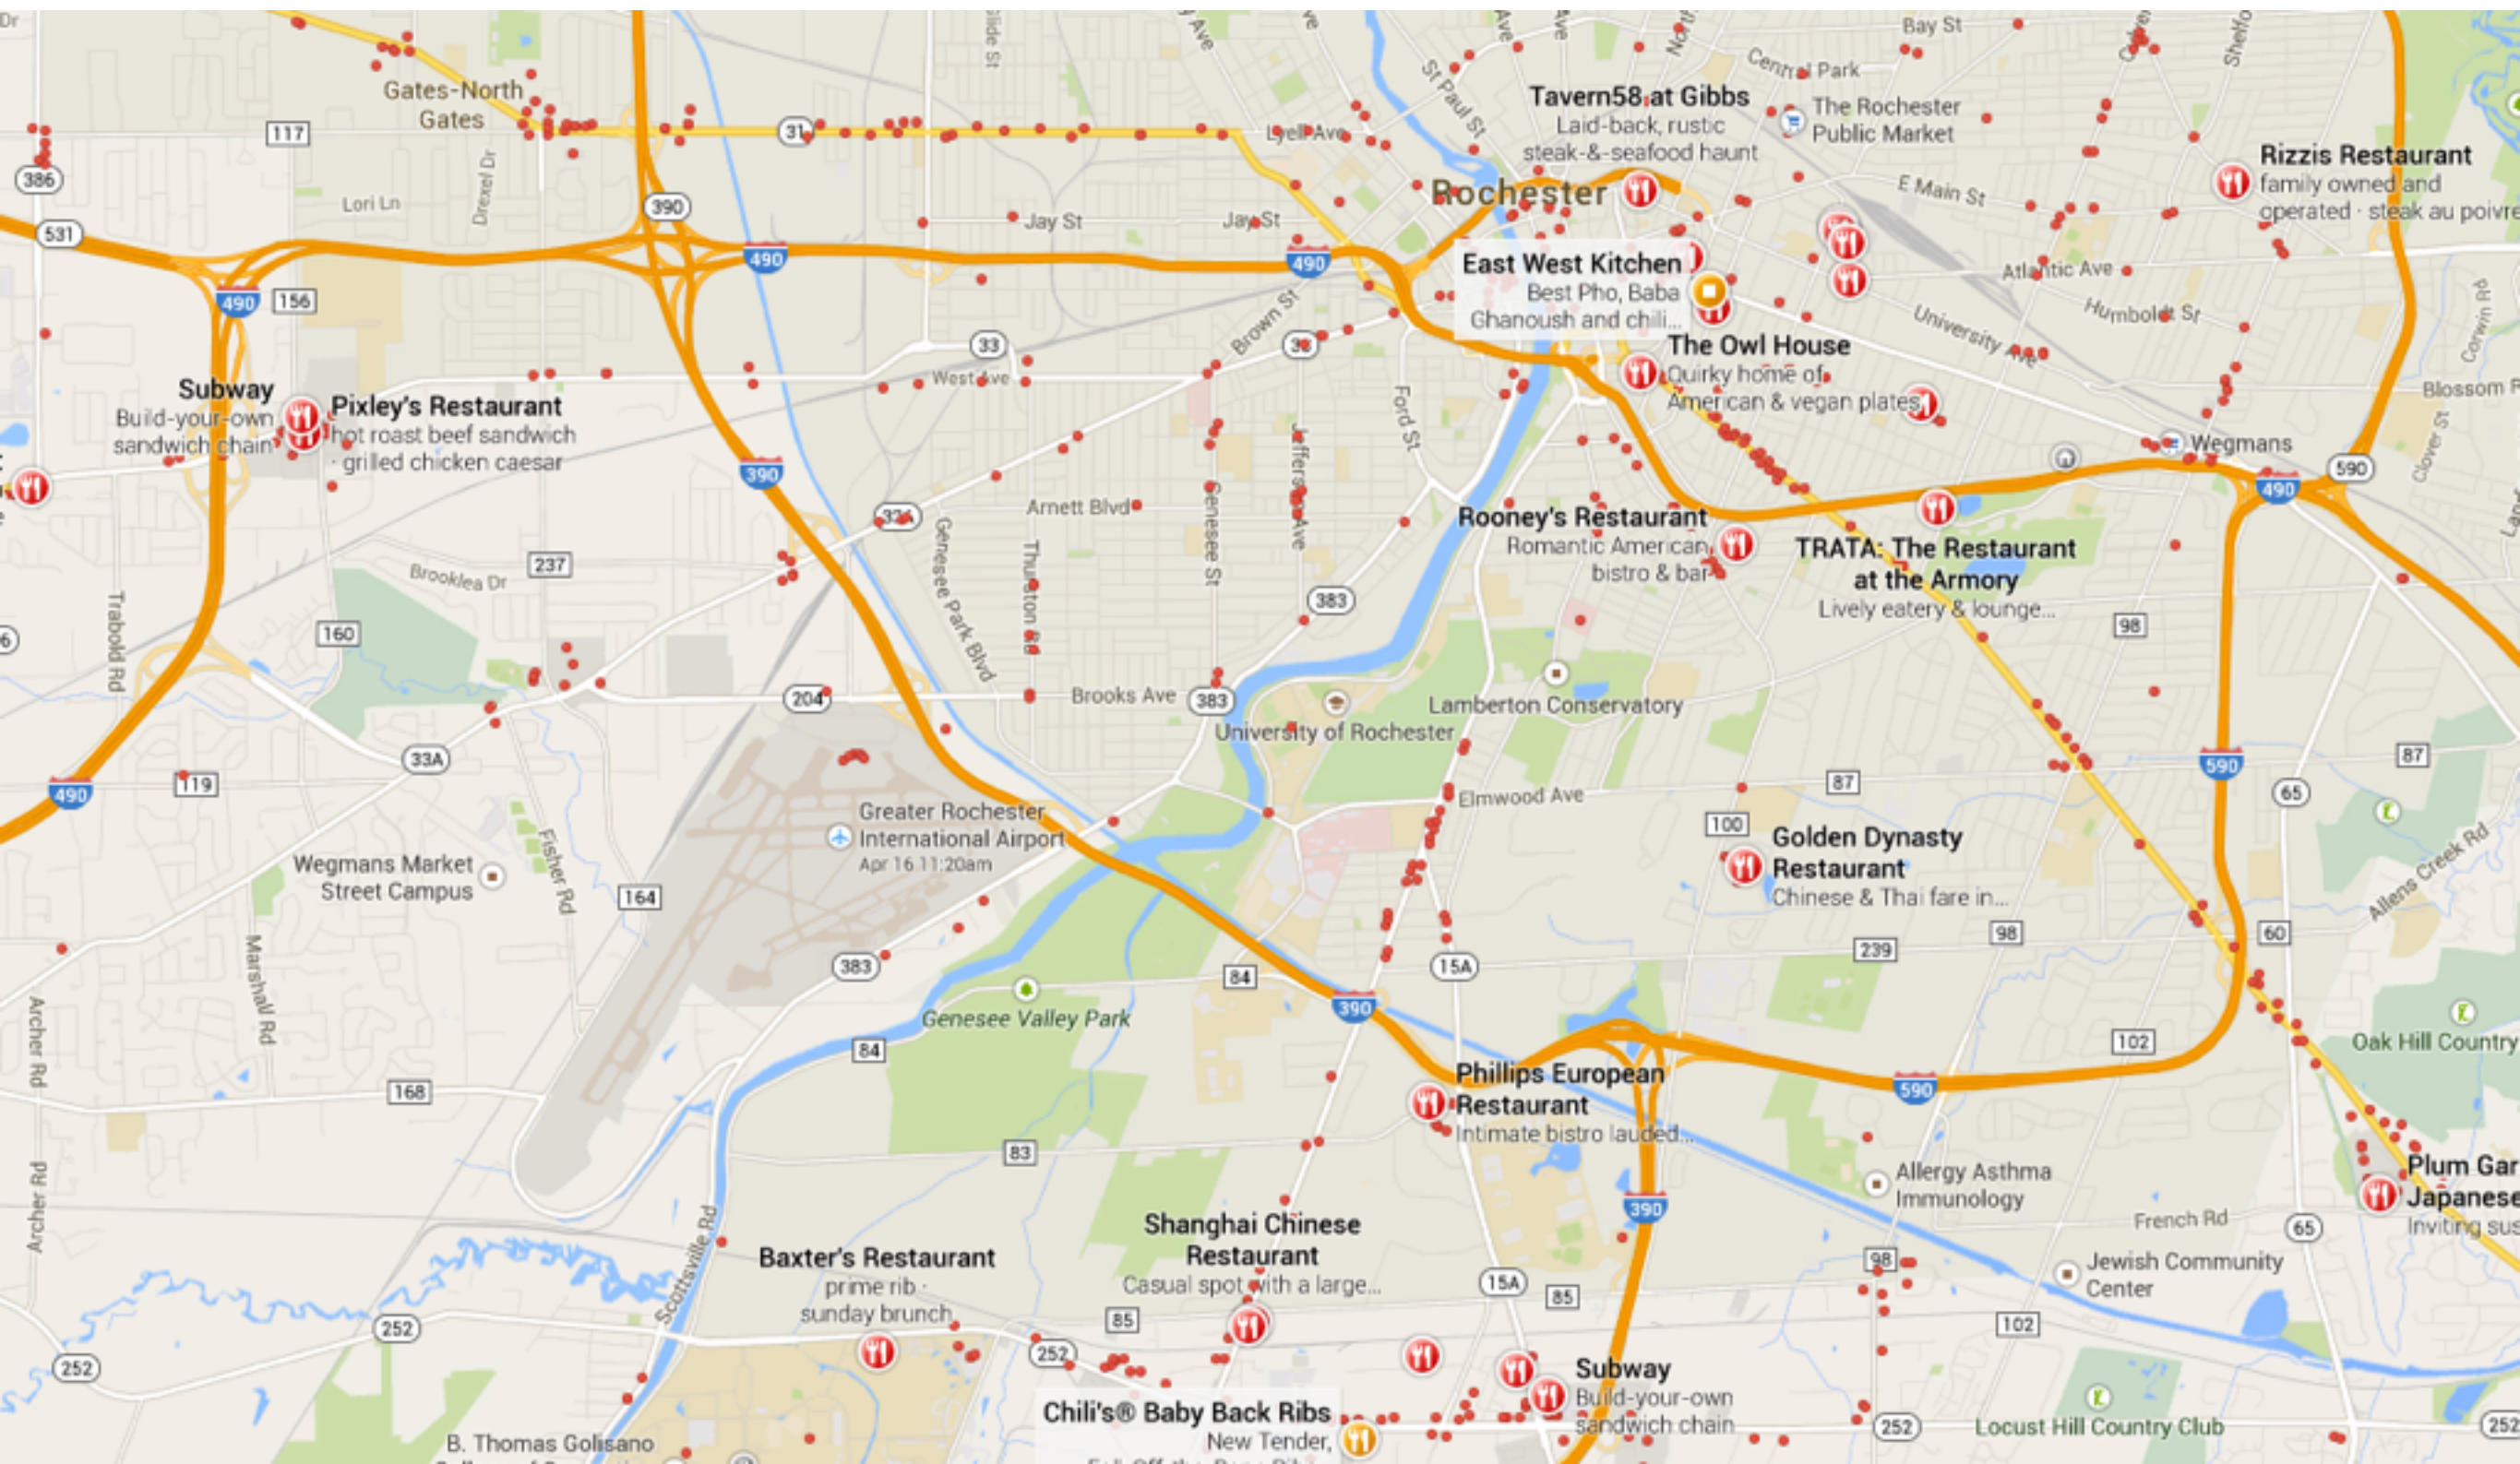

vs

Improving existing paradigms

Limited I/O

- Problem: output area is too small
- Problem: input area is too small
